Subject: RE: OPL Indicator and PCR

Actually, I don't think this is all that bad. When the biomarker is quantifiable, the correlation with the coliforms is fairly good for environmental data. Also, there could be other sources of coliforms in the watershed that would contribute to the fecal material count, but that are not the poultry litter. This is not good for the litigation against poultry farmers (i.e., other sources of fecal material), but doesn't have any bearing on the validity of the biomarker.
